CERTIFICATE

*This is to certify that the Project report entitled "Central Service Portal" is a bonafide record of the work done by **HISANA HAMZA (MEA25MCA-2010**) under our supervision and guidance. The report has been submitted in fulfillment of the requirement for award of the Degree of Master of Computer Applications from the APJ Abdul Kalam Kerala Technological University for the year 2026.*

Mr. Adil Narakkoden

Assistant Professor

Project Guide

Dept. of Computer Applications

Mr. Sajeesh M

Assistant Professor

Head of the Department

Dept. of Computer Applications

Acknowledgements

First and foremost, We would like to thank the Almighty God for giving us the knowledge and strength which helped us in the successful completion of this project.

An endeavor over a long period may be successful only with advice and guidance of many well wishers. We take this opportunity to express our gratitude to all who encouraged us to complete this project. We would like to express our deep sense of gratitude to our respected **Principal Dr. Shahir VK** for his inspiration and for creating an atmosphere in the college to do the project.

We would like to thank **Mr. Sajeesh M, Assistant Professor and Head of the Department**, for providing permission and facilities to conduct the project in a systematic way. We are highly indebted to **Mr.Adil Narakkoden,** Assistant Professor in Department of Computer Applications for guiding us and giving timely advices, suggestions and wholehearted moral support in the successful completion of this project.

Our sincere thanks to Project Co-ordinator Mr. Adil Narakkoden, Assistant Professor in Department of Computer Applications for his wholehearted moral support in completion of this project.

HISANA HAMZA (MEA25MCA-2010)

DATE: OCTOBER 25, 2026

ABSTRACT

The internship search and application process for students is often scattered across different platforms, making it difficult to find suitable opportunities, submit applications, and track application progress efficiently. Traditional internship management methods may involve manual communication and record keeping, which can lead to delays, difficulty in monitoring applications, and limited communication between students and organizations. Students may also face challenges in receiving timely updates regarding their application status.

To overcome these challenges, I developed an **InternHub – Internship Management System**, a web-based application that provides a centralized platform for managing the complete internship process. The system enables students to register, securely log in, create and view their profiles, browse available internships, search for suitable opportunities, view detailed internship information, and submit applications online. Students can also view their submitted applications and receive notifications regarding application updates. Administrators, through the Django administration panel, can manage internship postings, view registered students and applications, update application statuses such as Pending, Under Review, Shortlisted, Selected, or Rejected, and manage notifications.

The application provides a centralized and user-friendly platform that reduces manual work, improves transparency, and simplifies internship management for both students and administrators. It enables students to track their applications and receive timely status updates, while administrators can efficiently monitor and manage the overall internship process. The system was developed using **HTML and CSS** for the frontend, **Python with Django** for the backend, and **MySQL** as the database, providing a structured, reliable, and efficient solution for internship management.

INTRODUCTION

1. INTRODUCTION

Internships provide students with valuable opportunities to gain practical knowledge, develop professional skills, and obtain experience in real-world work environments. However, many students still depend on different websites, social media platforms, and manual communication methods to find internship opportunities and submit applications. This makes the process time-consuming and difficult to manage, while students may also face challenges in finding suitable internships, tracking application progress, and receiving timely updates about their applications.

To address these issues, I developed an **InternHub – Internship Management System**, a web-based platform designed to centralize and simplify the complete internship management process. The system provides a centralized environment where students can register, securely log in, maintain their profiles, browse available internships, search for suitable opportunities, view detailed internship information, and submit internship applications conveniently through the application. Students can also view their submitted applications and monitor their current application status.

The platform also enables administrators to manage internship postings, view registered students, monitor submitted applications, and update application statuses such as Pending, Under Review, Shortlisted, Selected, and Rejected. Students receive notifications whenever there is an update to their application status. By integrating these operations into a single platform, the system improves accessibility, transparency, and communication between students and administrators while reducing manual effort and making the overall internship management process more efficient.

SYSTEM ANALYSIS

.

.

2. SYSTEM ANALYSIS

2.1 Existing System

In the existing system, internship opportunities are often managed through different websites, social media platforms, emails, and manual communication. Students must search through multiple sources to find suitable internships and may need to contact organizations separately to obtain information and submit applications. Application records and updates are often maintained manually, making the process time-consuming, unorganized, and prone to errors. The absence of a centralized system also makes it difficult for students to track their applications and for administrators to effectively manage internship postings, student applications, and application status updates.

2.2 Proposed System

The proposed InternHub – Internship Management System provides a centralized web-based platform for managing the complete internship process. Students can register, securely log in, maintain their profiles, browse and search available internships, view detailed internship information, and submit applications online. Students can also track their submitted applications and receive notifications regarding application status updates. Administrators can manage internship postings, view student applications, update application statuses, and monitor overall system activities. The system improves efficiency, transparency, communication, and application tracking while reducing manual effort in internship management.

2.3 Module description

The system is divided into 3 modules based on user roles, each with specific functionalities:

Admin

- Manage internship listings
- View registered students
- View and manage applications
- Update application status
- Manage notifications

Student

- Register and log in
- Manage student profile
- Search and browse internships
- View internship details
- Apply for internships

Notification & Application Tracking

- View submitted applications
- Track application status
- Prevent duplicate applications
- Generate application notifications
- Notify students about status changes
- View application-related notifications

2.4 Sprint

Sprint 1

Module	Task	Pending task if any	Hour of completion	Expected date of completion	Actual date of completion	Reason for delay
User	Login page	-	2 hr.	15/07/2026	15/07/2026	-

FEASIBILITY STUDY

3.FEASIBILITY STUDY

An analysis of the ability to complete a project successfully, taking into account legal, economic, technological, scheduling, and other factors is considered as feasibility study. Rather than just diving into a project and hoping for the best, feasibility study allows project managers to investigate the possible negative and positive outcomes of a project before investing too much time and money.

3.1 Economical Feasibility

The project is economically feasible as it uses open-source technologies such as Python, Django, HTML, CSS, and MySQL, which reduce development costs. The system minimizes manual work and paperwork by providing a centralized platform for internship management. It also saves time and resources by simplifying internship applications, tracking, and notifications. Therefore, InternHub provides a cost-effective and efficient solution for managing the internship process.

3.2 Technical Feasibility

The proposed system is technically feasible because it is developed using **HTML, CSS, Python, Django, and MySQL**. These technologies are reliable and suitable for developing a secure and scalable web-based application. The Django framework provides a structured architecture that makes the system easy to maintain, update, and expand with additional features in the future.

3.3 Operational Feasibility

The proposed system provides a simple and user-friendly interface for **students and administrators**. It simplifies internship searching, application submission, application tracking, and notification management. The system reduces manual work and improves the efficiency of managing internship opportunities and applications.

3.4 Behavioral Feasibility

The system is designed to be easy to learn and use, requiring minimal training for students and administrators. Clear navigation, simple forms, and application status updates make the system convenient for users. The digital workflow also improves communication between students and administrators.

3.5 Software Feasibility

The application is developed using **HTML, CSS, Python, Django, and MySQL** and can be accessed through modern web browsers such as **Google Chrome, Microsoft Edge, and Mozilla Firefox**. The system can operate on common operating systems such as **Windows, Linux, and macOS**, without requiring specialized application software on the user's device.

3.6 Hardware Feasibility

The proposed system requires only a standard **desktop, laptop, or smartphone** with an internet connection and a modern web browser. Students and administrators can access the system using commonly available devices, eliminating the need for specialized hardware and reducing implementation costs.

SOFTWARE ENGINEERING PARADIGM

4. SOFTWARE ENGINEERING PARADIGM

The software engineering paradigm which is also referred to as a software process model or Software Development Life Cycle (SDLC) model is the development strategy that encompasses the process, methods and tools. SDLC describes the period of time that starts with the software system being conceptualized.

4.1 Agile model

Agile SDLC model is a combination of iterative and incremental process models with focus on process adaptability and customer satisfaction by rapid delivery of working software product. Agile Methods break the product into small incremental builds. These builds are provided in iterations. Each iteration typically lasts from about one to three weeks. At the end of the iteration, a working product is displayed to the customer and important stakeholders.

In Agile, the tasks are divided to time boxes (small time frames) to deliver specific features for a release. Iterative approach is taken and working software build is delivered after each iteration. Each build is incremental in terms of features; the final build holds all the features required by the customer.

4.2 Scrum

Scrum is an agile framework for managing knowledge work, with an emphasis on software development. It is designed for teams of three to nine members, who break their work into actions that can be completed within time boxed iterations, called "sprints", no longer than one month and most commonly two weeks, then track progress and re-plan in 15-minute stand-up meetings, called daily scrums.

Scrum is an iterative and incremental framework for product development. It promotes a flexible strategy where development teams collaborate to achieve common goals, challenging traditional sequential methods. Scrum encourages self-organization, physical co-location, and daily communication among team members.

SYSTEM REQUIREMENTS SPECIFICATION

5. SYSTEM REQUIREMENTS SPECIFICATION

5.1 Software Requirements

Component	**Requirement**
Operating system	Windows 8 or above
Backend	Python with Django
Frontend	Html, CSS
Database	MySQL
IDE	VS Code

5.2 Hardware Requirements

Component	**Requirement**
Processor	Intel core i3 or above
RAM	Minimum 8GB (recommended 16GB)
Monitor	14" LCD or Above
Key Board	108 Keys
Mouse	Any type of mouse

SYSTEM DESIGN

6. SYSTEM DESIGN

System design is the first in the development phase for many engineered product or system. It may define the process of applying various techniques and principles for the purpose of defining a device, a process or system in sufficient detail to permit its physical realization.

6.1 Database Design

Database design is the process of producing a detailed data model of a database. This logical data model contains all the needed logical and physical design choices and physical storage parameters needed to generate a design in a data definition language, which can then be used to create a database.

In the relational model, tables and views represent data, while in an object database, entities and relationships correspond to object classes. Database design encompasses not only base data structures but also forms and queries within a database management system. The design process involves several steps, primarily focusing on determining relationships between data elements and establishing a logical structure, leading to normalization.

Normalization

It is the procedure of transforming a relationship into a standard form. This process addresses issues that may arise from data redundancy, which refers to the repetition of data within the database. Additionally, it helps maintain data integrity and resolves potential problems related to insertion, updating, and deletion anomalies.

Decomposing is the process of breaking down relations into several smaller relations to eliminate anomalies and uphold data integrity. To achieve this, normal forms or guidelines for structuring relations are utilized.

Insertion anomaly: Inability to add data to the database due to absence of other data.

Deletion anomaly: Unintended loss of data due to deletion of other data.

Update anomaly: Data inconsistency resulting from data redundancy and partial update.

Normal Forms: These are the rules for structuring relations that eliminate anomalies.

1. First Normal Form (1NF)

A relation is considered to be in first normal form when all values within that relation are atomic for each attribute. This means that no attribute value can consist of a set of values or, as it's often described, a repeating group.

2. Second Normal Form (2NF)

A relation is in second normal form if it is in first normal form and meets at least one of the following rules.

- Primary key is not a composite primary key
- No non key attributes are present
- Every non key attribute is fully functionally dependent on full set of primary keys.

3. Third normal Form (3NF)

A relation is said to be in third normal form if there exist no transitive dependencies.

Transitive dependency occurs when two non-key attributes depend on each other and on the primary key. This normalization principle helps decompose data into multiple tables, ensuring consistent data maintenance.

In Third Normal Form (3NF), the main goal is to remove transitive dependencies, which means that non-key attributes should depend only on the primary key, not on other non-key attributes. This ensures that every piece of data in a table describes only the entity represented by that table. By eliminating transitive dependencies, we avoid redundancy and make updates, insertions, and deletions more efficient and error-free.

Overall, 3NF improves database design by making it cleaner, more flexible, and easier to maintain. It minimizes duplicate data and maintains data consistency across relationships, which is crucial for large and frequently updated databases.

6.2 Tables

Student

FIELD NAME	DATA TYPE	CONSTRAINTS
id	INT	Primary Key
user_id	INT	Foreign Key
name	VARCHAR(200)	NOT NULL

password	VARCHAR	NOT NULL
email	VARCHAR	_

6.3 UML Designs

The unified Modelling Language (UML) is a standard language for specifying, visualizing, constructing, and documenting the artifacts of the software systems, as well as for business modelling and other non-software systems. The UML represents a collection of best engineering practices that have proven successful in the modelling of large and complex systems. The UML is a very important part of developing object-oriented software and software development process. The UML uses mostly graphical notations to express the design of software projects. Using the UML helps project teams communicate, explore potential designs, and validate the architectural design of the software.

6.4 User Story

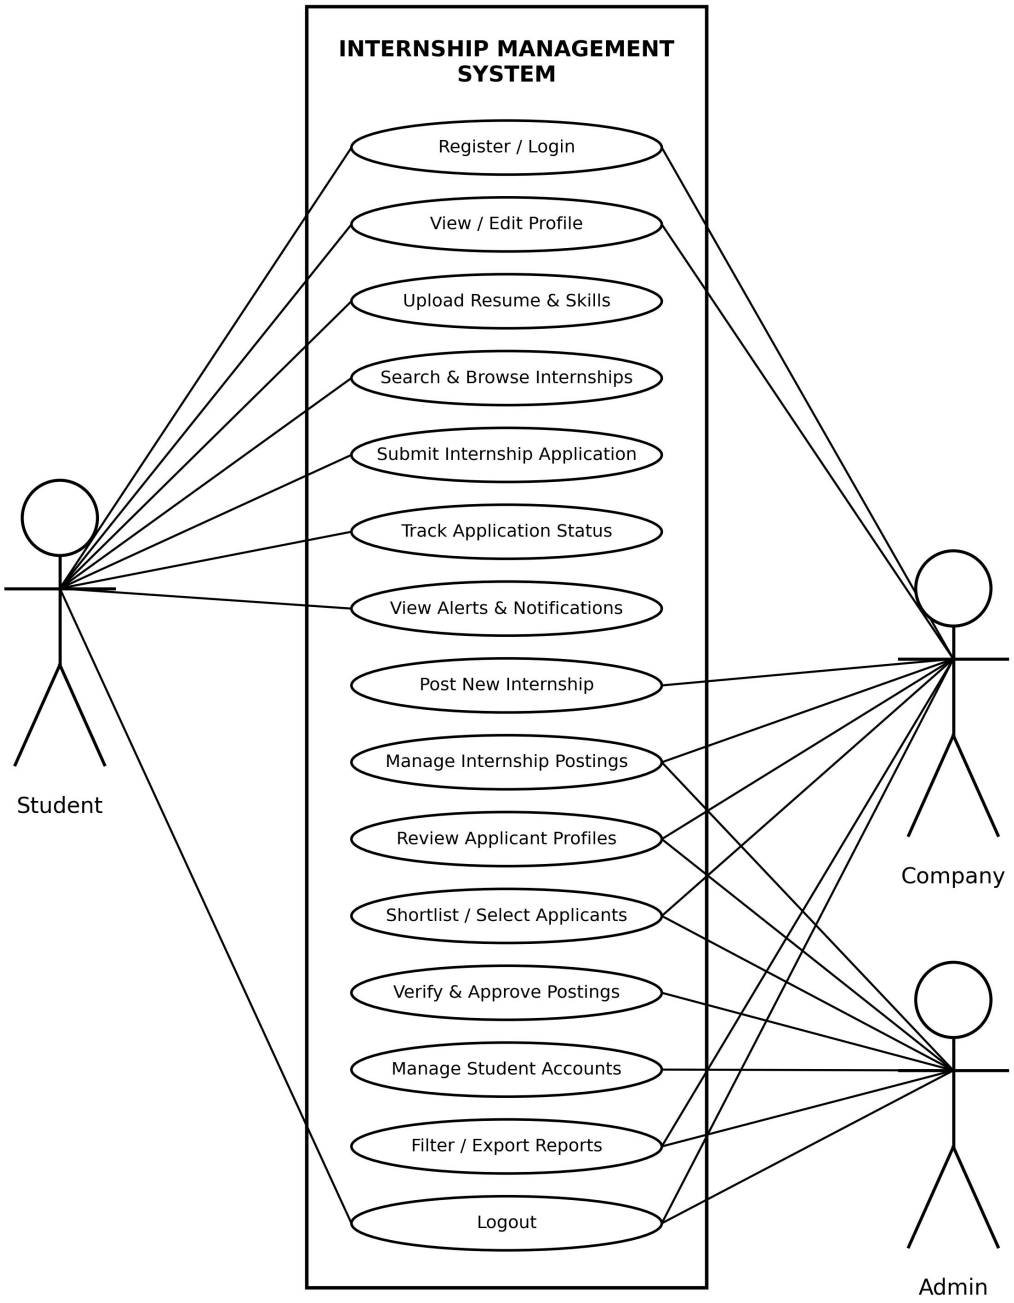

As a student, I want to register on the InternHub system, create my profile, and securely log in so that I can access internship opportunities. I want to browse and search available internships by title, company, location, or required skills, view complete internship details, and apply for suitable internships so that I can find relevant opportunities easily. I also want to view my submitted applications, track their current status, and receive notifications whenever my application is submitted or its status is updated.

As an administrator, I want to manage internship listings by adding, editing, and deleting internship details, view registered students and their applications, and update application statuses such as Pending, Under Review, Shortlisted, Selected, or Rejected. As the system, I want to prevent duplicate applications, maintain accurate student and application records, and automatically generate notifications when applications are submitted or their status changes so that the internship management process remains organized, transparent, and efficient.

6.5 Use case diagram

A use case diagram is a visual representation that shows how different users (called actors) interact with a system to achieve specific goals. It's one of the primary diagrams used in Unified Modeling Language (UML) to capture functional requirements. Each use case represents a particular function or service the system provides, and the relationships between actors and use cases show who can perform which actions. This helps developers and stakeholders quickly understand what the system is supposed to do from a user's perspective, without needing to go deep into technical details.

In software development, use case diagrams are especially useful during the analysis and design phase. They help identify the main system functions, clarify user roles, and ensure that all requirements are captured before development begins. These diagrams serve as a communication bridge between clients, developers, and testers, reducing misunderstandings. By visually outlining the interactions, they make it easier to plan, document, and verify system behavior in real-world scenarios.

Use Case Diagram – InternHub

6.5 Scenario

A scenario is a detailed description of a particular situation or sequence of events that helps illustrate how a system or process works. In software engineering, scenarios are often used to show how users interact with a system to achieve specific goals. For example, a scenario might describe how a student logs into a college portal, applies for leave, and checks approval status. Scenarios make it easier to understand user needs, test different conditions, and visualize the flow of operations within a system. They serve as practical examples that bridge the gap between theoretical requirements and real-world usage.

STUDENT / APPLICANT

- Student can Register with email, phone, and course details, and Login securely.
- Student can View and Update Profile Information including contact details.
- Student can Upload and Replace Resume documents and highlight technical skills.
- Student can Search and Filter Available Internships by title, role, company or skills.
- Student can View Detailed Internship Descriptions, stipend, duration, and deadlines.
- Student can Submit Applications for eligible internships (preventing duplicate entries).
- Student can Track Current Application Status in real time.
- Student can View In-App Notifications regarding status updates and new openings.
- Student can Logout from the portal.

COMPANY / RECRUITER

- Company can Register recruiter credentials and Login after account verification.
- Company can View and Update Company Profile and contact information.
- Company can Post New Internship Openings with detailed requirements and deadlines.
- Company can Manage and Edit Active Postings (update criteria, close positions).
- Company can Access and Review Applicant Profiles along with uploaded resumes.
- Company can Update Application Status (Pending, Under Review, Shortlisted, Selected, Rejected).
- Company can Filter and Export Candidate Reports for recruitment analysis.
- Company can Logout securely.

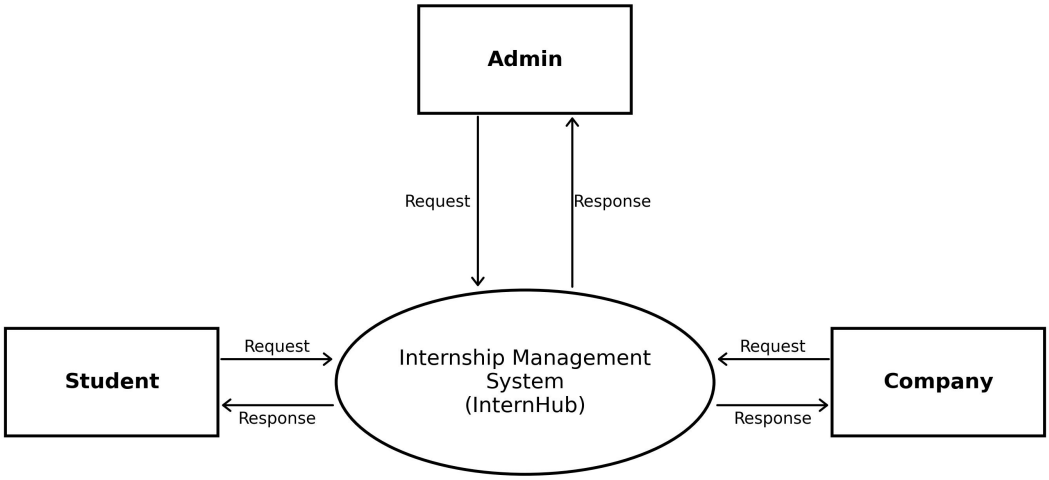

ADMIN / MODERATOR

- Admin can Login securely to the administrative portal .
- Admin can Oversee all active internship Postings across companies.
- Admin can Verify, Approve, Edit, or Remove inappropriate internship postings.

- Admin can View and Manage Registered Student Accounts and academic profiles.
- Admin can Review Applications across all listings to ensure fair process.
- Admin can View Central Dashboard Analytics and placement statistics.
- Admin can Generate and Export Global Placement Audit Reports.
- Admin can Logout from the administrative console.

7. SYSTEM DEVELOPMENT

System development is series of operations to manipulate data to produce output from computer system. The principal activities performed during the development phase can be divided into two major related sequences.

- External system development
- Internal system development

The major external system activities are Implementation Planning, Equipment Acquisition, Installation.

7.1 Coding

The purpose of code is to aid in identifying and retrieving information. It consists of an ordered collection of symbols for unique identification of entities or attributes, illustrating interrelationships among items. Codes facilitate identification, access, sorting, and matching records, ensuring each code has a single, clear meaning for the entity or attribute.

Python

Python is a high-level, interpreted programming language known for its simple and readable syntax. It supports object-oriented, procedural, and functional programming approaches. Python is widely used for web development, data processing, automation, and software development. In the InternHub project, Python is used as the main programming language for implementing the backend logic and application functionality.

Django

Django is a high-level Python web framework used for developing secure and maintainable web applications. It follows the Model-View-Template (MVT) architectural pattern and provides built-in features such as URL routing, authentication, forms, database interaction, and an administrative interface. In InternHub, Django is used to manage student registration, login, internship listings, applications, notifications, and administrative operations.

MySQL

MySQL is an open-source relational database management system used to store and manage structured data. It supports SQL for creating, retrieving, updating, and deleting data from relational tables. MySQL provides features such as relationships, constraints, indexing, and transaction management. In InternHub, MySQL is used to store student details, internship information, applications, notifications, and other system data.

HTML

HTML (HyperText Markup Language) is the standard markup language used to create and structure web pages. It defines elements such as headings, paragraphs, forms, buttons, tables, links, and other page components. In InternHub, HTML is used to create the structure of the home page, registration page, login page, dashboard, internship pages, application pages, and profile pages.

CSS

CSS (Cascading Style Sheets) is a stylesheet language used to control the appearance and layout of web pages. It is used to define colors, fonts, spacing, alignment, buttons, forms, navigation bars, and responsive layouts. In InternHub, CSS is used to provide a consistent and user-friendly interface for students and administrators.

Django ORM

Django ORM (Object-Relational Mapping) is a feature of Django that allows developers to interact with the database using Python objects and model classes instead of writing SQL queries directly. It supports operations such as creating, retrieving, updating, and deleting records. In InternHub, Django ORM is used to manage student, internship, application, and notification data in the MySQL database.

Django Forms

Django Forms provide a structured way to collect, validate, and process user input. ModelForms can automatically create form fields based on Django models and provide built-in validation. In InternHub, Django Forms are used for student registration, profile editing, login-related input, and resume file uploading.

8. SYSTEM TESTING AND IMPLEMENTATION

Testing is vital to the success of the system. It makes a logical assumption that if all the parts of the system are correct, the goal will be successfully achieved in this project. It is the stage of implementation, which ensures that system works accurately and effectively before the live operation commences. It is a confirmation that all are correct and opportunity to show users that the system must be tested and show that the system will operate successfully and produce expected results under expected conditions. Software testing is a crucial element of software quality assurance and represents the unlimited review of specification, design and coding. Testing represents an interesting anomaly for the software. During the earlier definition and development phase, it was attempted to build the software from an abstract concept to implement.

Testing involves planned activities conducted systematically to ensure a system operates accurately and efficiently before live operations begin.

8.1 Types of Testing

Different types of testing are,

- Unit testing
- Integration testing
- System testing
- Validation testing
- User acceptance testing.

Unit Testing

Unit testing typically takes place during a combined code and unit testing phase within the software life cycle, although coding and unit testing may sometimes occur as separate phases. Each module is tested individually upon completion to ensure proper functionality. The focus of unit testing is to evaluate a unit as a whole, assessing the interaction of multiple functions while keeping the test confined to a single unit. This testing is conducted during the programming stage to verify that each module performs satisfactorily against the expected output. Unit Testing is a software testing method where individual components or modules of a program are tested separately to ensure each part works correctly. It helps identify and fix bugs early in development, making the code more reliable and easier to maintain.

Integration Testing

Integration testing systematically tests the combined modules of a system, such as login, registration, and admin functions, to identify and correct errors at the interface. This process ensures that data integrity is maintained, and that individual modules work together effectively to achieve the desired overall functionality. The goal is to combine unit-tested modules and evaluate them as a complete program.

- The system contains various components and they have to be combined and tested.
- The software is embedded into hardware and tested.

- The modules are combined and tested.
- The hardware part tested separately.

System Testing

Following the completion of validation testing, the subsequent step involves output testing of the proposed system. A system is deemed ineffective if it fails to generate the required data in the specified format. During output testing, the format of the data displayed or generated by the system is evaluated by soliciting feedback from the user. It has been confirmed that the output format on the screen aligns correctly with the specifications established during the system design phase, tailored to meet user requirements. Consequently, no corrections are necessary for the system as a result of output testing.

User Acceptance Testing:

User acceptance is crucial for a system's success. To ensure this, the system is tested by maintaining communication with prospective users during development, allowing for necessary changes based on their feedback.

- Output Screen design.
- Input Screen design.
- Menu driven system.

8.2 Implementation

Implementation is the stage of project, when theoretical design is turned into a working system. The most crucial stage is achieving a successful system and confidence that the new system will work effectively. It involves careful planning, investigation of the manual system and transition to the new system.

Implementation is the process of transforming a new or updated system design into a functional operation, involving all necessary activities to transition from the old system to the new one.

- Careful planning.
- Investigating the current system and its constraints on implementation.
- Design of methods to achieve the changeover.
- Training of the staff in the procedure and evaluation of change over method.

Implementation is the final and crucial phase of a project. It begins with planning methods for execution. After successful system implementation, user training becomes essential, involving the preparation of user manuals. Changeover is vital, ensuring the developed tool meets requirements before user acceptance. It occurs only when the system satisfies the analysis and all implementation tasks are completed.

9. SYSTEM MAINTENANCE

Maintenance is making adaptation of the software for external changes (requirements changes or enhancements) and internal changes (fixing bugs). When changes are made during the maintenance phase all preceding steps of the model must be revisited.

There are three types of maintenance:

- Corrective (Fixing bugs/errors)
- Adaptive (Updates due to environment changes)
- Perfective (Enhancements, requirements changes)

Maintenance presents a complex challenge within system development. The definition of software maintenance can be articulated through four key activities that occur after the program is released for use.

Understanding software maintenance is crucial because it's unrealistic to expect that testing will identify every issue in a large system. Ongoing maintenance is necessary due to the rapid changes that occur across all areas of computing. Enhancements often involve recommending new features, modifying existing functions, and making general improvements as the software is utilized. Additionally, changes may be implemented to enhance the software's maintainability or reliability for future use.

10. FUTURE ENHANCEMENT

The Central Service Portal has been designed with flexibility and scalability in mind, allowing for future enhancements to further improve its functionality and effectiveness. Some potential areas for future enhancements include:

1. Enhanced Accessibility: Introducing support for multiple languages and accessibility features to ensure inclusivity and enable participation from a wider range of citizens, including those with disabilities.

2. Personalized Surveys: Implementing personalized survey features that tailor questions and content based on demographic information or previous survey responses, enhancing engagement and relevance for participants.

3. Integration with social media: Enabling integration with social media platforms to facilitate sharing of survey links, increase awareness, and encourage participation among citizens through social networks.

4. Predictive Analytics: Leveraging machine learning and predictive analytics techniques to forecast future trends, anticipate citizen needs, and proactively address potential issues based on historical survey data.

By continuously enhancing the Central Service Portal with these and other innovative features, it can evolve into a comprehensive platform for citizen engagement, data-driven governance, and improving the quality of public services based on citizen feedback and participation.

11. CONCLUSION

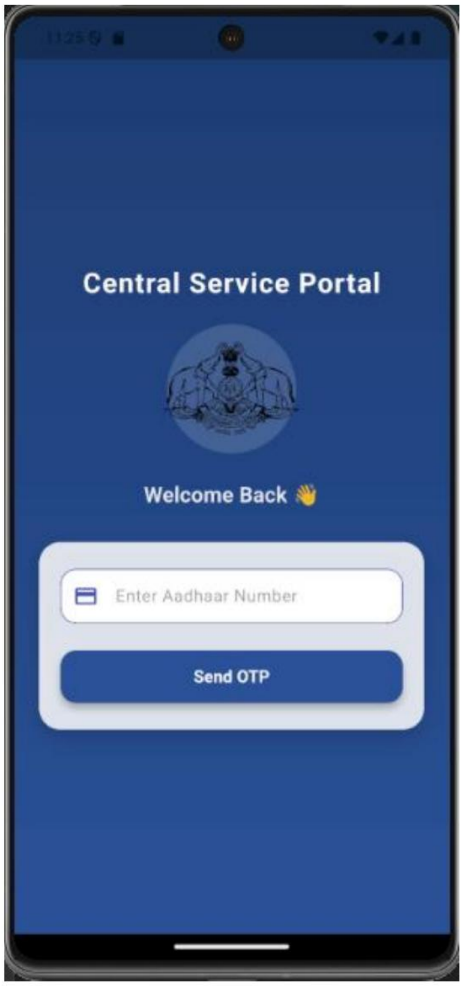

The Central Service Portal project has been successfully developed with meticulous effort aimed at enhancing citizen engagement and facilitating data-driven decision-making processes. This system was designed to streamline the process of conducting surveys, gathering valuable feedback from citizens, and providing insights for policymakers. Throughout the development process, rigorous testing was conducted to ensure the system's performance met the required standards. The results of these tests indicate that the system operates effectively and efficiently, meeting the needs of both administrators and citizens alike.
